

RETROFIT METALLIC FILTER CLOTH

Metallic filter cloths show several advantages compared to standard filter cloths in PP or E-CTFE.

Advantages

- + No fibres in the product
- + Filter cloth is endless, thinner filter cloths can be installed with overlapping
- + Improved residual heel removal
- + Lower product adherence to filter cloth because the cloth and product do not intertwine
- + No changes in the cloth characteristics (PP filter cloths are more temperature sensitive as well as to certain solvents)
- + Tests have shown a much higher service life
- + Lower costs compared to the version with sintered filter basket and removable basket brim
- + Can be installed in all Ferrum scraper centrifuges
- + No mechanical adjustments to the standard baskets required (for 10 mm drainage holes)
- + Changing back to PP filter cloths possible at any time

Technical data

See attached datasheets

Disadvantages

- + Possible slight colouration of the filter cloth at the welding seam
- + For the "endless" version, the basket must be individually measured with Ferrum measuring tape to assure correct fit

Materials

- + DIN 1.4404 (AISI 316L)
